Simulated Chat Experience

- When the user sends a message, the simulated assistant first responds with "Assistant is typing…".
- After one second, the typing indicator is replaced with the final message.
- Final message: "Thank you for your message. I've recorded it."
- ~~You will also find extra returning messages in media assets folder.~~ (Cancelled, the only final message is "Thank you for your message. I've recorded it.")
- If the assistant is already responding, the user must be able to stop the response.
- When the user stops the response, the typing indicator is replaced by the message "User cancelled."

Chat Messages Format Rendering (Cancelled)

Cancelled. Plain text message return as is. No any formatting or rendering needed.

Accessibility (Added)

- The web app must be fully controllable using the keyboard.
- Tab order follows the visual and logical flow: Sidebar → Toggle → Input → Send.
- The sidebar has the navigation landmark and an updated toggle state (aria-expanded).
- The messages area uses role="log" aria-live="polite" aria-label="Chat messages".
- Each message has the article role and a descriptive aria-label connecting speaker, time, and content.
- The assistant typing indicator has the status role.
- After sending a message, focus returns to the message input field.
- When selecting a conversation from the sidebar, focus moves to the input field.
- No keyboard traps; the user can freely move in and out of all components using Tab.
- Accessibility must not be over-engineered; use semantic HTML first and ARIA only where necessary.
- The sign-in method chooser is a native radio group wrapped in a <fieldset> with a <legend>.
- Every form control (text input, password input, radio button) has a correctly associated <label> using matching for and id attributes.
- Hint text for each input and each radio option is linked to the control with aria-describedby.
- All radio options can be selected using the keyboard alone (arrow keys within the group) and show a clearly visible focus indicator.
- When a sign-in radio option receives focus, screen readers announce the option label together with its hint text (for example: "Guest mode, Continue without an account; the session is cleared when you close the browser").

Keyboard Shortcuts (Added)

- Ctrl + \ toggles the visibility of the sidebar.
- / focuses the message input field. When the message input or any text field is already focused, / types a literal character and does not trigger the shortcut.
- Pressing Enter on a selected chat while in keyboard navigation in the history activates that chat.
- Full Tab and Shift+Tab navigation between actionable UI components.
- A clearly visible keyboard focus indicator on all interactive elements.
